

Elevator pitch (MusicYou)

Music4You is a sleek, API driven Music Artist library and ticket search engine.

Users can create and customise their own cards of their favourite artists, which fetches data from 3 APIS :(Discogs, lastFM and ticketmaster)

The artists “Card” is stored as an object array within the users local storage which allows for fast loading times and negates the need to re-fetching the data again, once a card has been stored. It persists in local on refresh.

When a user searches an artist, an card is dynamically rendered to the page and displays the artist name, genre and bio image.

Two buttons appear below:

“Playlist” allows the user to listen to the artist playlist, watch music videos, read the artist’s biography or even find similar artists or entire genre playlists!

The “get tickets” button pulls the artist data and any event information from ticketmaster and displays it in a modal pop up. If the artist isn’t touring then an alternative modal is presented with a Call To Action.

Future features include an in-built artist page, a music player iFrame and advanced touring and ticket booking engine.

We hope you enjoy curating your own artist library , discovering new artists and we would now like to offer a demonstration!
